Hello Steve, I had a question about a couple older amps your company built. What I have are 2 ESX Q120.4s and a Autotek MX1300. All have the min-din balanced input and I would like to use them with a Zapco DSP-6 processor. First is do you know if the pin out for the Zapco and these amps are compatible? Second I plan to bridge the two Q120.4s and use one on the midwoofer and the other on tweeters as a bi-amped set-up. When doing this will I need a mini-din Y cable to feed the left and right "sides" of the balanced inputs? Thanks for any help and for making some of the best products for all these year. Love the Leviathan and Kronos I have in my other car. These "old school" amps are going in a throw back SQ car I'm building. Sorry to ramble. Thanks again. Zach
